

ALPS ADRIATIC WORKING COMMUNITY
PRESIDENCY OF REGIONE VENETO 2001 – 2002

A map of the Alps-Adriatic region, which includes parts of Italy, Austria, Slovenia, Croatia, and Bosnia-Herzegovina. The map is color-coded by country: Italy is yellow, Austria is light blue, Slovenia is green, Croatia is blue, and Bosnia-Herzegovina is grey. Overlaid on the map is the title "Alps Adriatic Statistical Atlas" in large, bold, blue letters.

Alps Adriatic Statistical Atlas

19th November 2002

**ALPS ADRIATIC WORKING COMMUNITY
PRESIDENCY OF REGIONE VENETO 2001 – 2002**

Alps Adriatic Statistical Atlas

19th November 2002

Presentazione

La Comunità di Lavoro Alpe Adria, prossima a compiere i venticinque anni dalla fondazione, avverte l'esigenza di aggiornare gli obiettivi a lungo termine della sua cooperazione.

Per questo, durante il biennio di presidenza della Regione Veneto 2001-2002, ha elaborato le proprie *Linee Guida nell'Europa degli anni 2000*.

Le regioni di Alpe Adria, poste in un complesso crocevia dell'integrazione europea, costituiscono uno straordinario punto d'incontro di popoli, lingue, culture e comunità.

Questo incontro impegna a sostenere il cammino nell'Unione Europea con il miglioramento della coesione economica e sociale.

Il presente *Atlante statistico* documenta, con il maggiore aggiornamento di dati risultato possibile, le molteplici e diverse realtà riscontrabili nel territorio di Alpe Adria.

Le regioni e le istituzioni che compongono la Comunità mirano a ridurre squilibri e disparità, ad avvicinare i tenori di vita esistenti tra le popolazioni.

Tali obiettivi richiedono elementi concreti di conoscenza: l'*Atlante statistico* offre un supporto a questo impegno.

Giancarlo Galan

Presidente della Regione Veneto
e della Comunità di Alpe Adria

Venezia, 19 novembre 2002

Einleitung

Die Arbeitsgemeinschaft Alpen-Adria, die bald ihr 25-jähriges Bestandsjubiläum feiern wird, ist derzeit im Begriff ihre langfristigen Kooperationsziele neu zu definieren.

Zu diesem Zweck wurde während des Vorsitzbienniums der Region Venetien, in den Jahren 2001-2002 ein *Leitbild im Europa des dritten Jahrtausends* ausgearbeitet.

Die Alpen-Adria-Länder befinden sich an einer überaus komplexen Schnittstelle der europäischen Integration, wo verschiedene Völker, Sprachen, Kulturen und Gemeinschaften aufeinander treffen.

Daraus erwächst der Wille einen gemeinsamen Weg nach Europa zu finden und sich für die wirtschaftliche und soziale Kohäsion einzusetzen.

Der vorliegende *Statistikatlas* mit den aktuellsten derzeit verfügbaren Daten liefert ein Bild der Vielfalt und der unterschiedlichen Gegebenheiten im Alpen-Adria Raum.

Die Regionen und Institutionen, aus welchen die Arbeitsgemeinschaft besteht, bemühen sich um eine Reduktion des bestehenden Ungleichgewichts und der Unterschiede im Lebensstandard der Bevölkerung der einzelnen Regionen.

Zur Erreichung dieses Ziels ist die genaue Kenntnis der konkreten Gegebenheiten unabdingbar. Der *Statistikatlas* liefert dafür eine Grundlage.

Giancarlo Galan

Präsident der Region Venetien
und der Arbeitsgemeinschaft Alpen-Adria

Venedig, 19. November 2002

Prezentacija

Radna zajednica Alpe-Jadran, koja će uskoro navršiti dvadeset pet godina od osnivanja, osjeca potrebu za osuvremenjivanjem dugorocnih ciljeva svoje suradnje.

Stoga je, za vrijeme dvogodišta predsjedanja regije Veneto 2001-2002., pripremila svoje *Smjernice u Europi u 21. stoljeću*.

Clanice RZ Alpe-Jadran, smještene na složenom raskrižju europskih integracija, predstavljaju izvanrednu točku susreta naroda, jezika, kultura i zajednica.

Ovaj susret nas obvezuje da razvoj u Europskoj uniji podupremo pospješivanjem ekonomske i socijalne kohezije.

Ovaj *Statisticki atlas*, objavljivajući podatke koje su u najvećoj mogućoj mjeri ažurirani, svjedoci o postojanju brojnih i razlicitih situacija na području RZ Alpe-Jadran.

Clanice i vlade koje čine Radnu zajednicu teže smanjenju neravnoteža i raznorodnosti, približavanju razlicitih životnih standarda stanovništva.

Ovi ciljevi zahtijevaju konkretne elemente i podatke: *Statisticki atlas* nudi potporu ovom zauzimanju.

Giancarlo Galan
Predsjednik regije Veneto
i predsjedatelj RZ Alpe-Jadran

Venezia, 19. studenoga 2002.

Bemutatása

Az Alpok Adria Munkaközössége, mely közel áll huszonötödik évfordulójához, szükségét érzi megújítani hosszútávú együttműködési célkitűzésit.

Ezért, kidolgozta Veneto Tartomány 2001-2002 közötti kétéves Elnökségi ciklus alatt, saját *Jövo képével a 21 század Európában*.

Az Európai integráció összetett keresztútján elhelyezkedő Alpok-Adria tartományok, rendkívüli találkozó pontot képeznek népek, nyelvek, kultúrák, és közösségek számára.

E találkozás, elkötelez minket az Európai Unióval való együttaladás támogatására, javítva a gazdasági és a társadalomi kohéziót.

Jelen *Statisztikai Atalsz*, a lehetségesnek bizonyult legfrissebb adatokkal dokumentálja az Alpok-Adria területén fellelhető sokszínű, eltérő valóságot.

A Munkaközösséget alkotó régiók és intézményei arra törekednek, hogy csökkentsék a különbségeket és az egyensúly hiányt, továbbá közelíteni szeretnék a lakosság eltérő életszínvonalát.

Ezen célok megkövetelik az ismeret konkrét elemeit: A *Statisztikai Atalsz* e tevékenységekhez kíván támogatást nyújtani.

Giancarlo Galan
Veneto Tartomány
és az Alpok-Adria Munkaközösségek
Elnöke

Velence, 2002 november 19.

Predstavitev

Delovna skupnost Alpe-Jadran, ki bo v kratkem dosegla petindvajsetletnico ustanovitve, cuti potrebo po ažuriranju dolgorocnih ciljev te oblike sodelovanja.

Prav zato je v casu predsedovanja regije Veneto v dveletnem obdobju 2001-2002 izdelala svoje »Smernice v Evropi v 21. stoletju«.

Clanice Alpe-Jadrana, ki ležijo na kompleksnem križpotu evropske integracije, predstavljajo izredno stičisce ljudstev, jezikov, kultur in skupnosti.

To dejstvo jih zavezuje, da podprejo razvoj Evropske unije tudi z izboljševanjem gospodarske in socialne kohezije.

Ta Statisticni atlas s svojim najboljšim možnim ažuriranjem podatkov prikazuje vse raznolike in razlicne stvarnosti, ki obstajajo na območju Alpe-Jadrana.

Regije in institucije, ki sestavljajo Delovno skupnost, si prizadevajo za zmanjševanje neravnovesij in razlik ter za izravnavanje življenskih pogojev prebivalstva.

Za doseganje teh ciljev so potrebni konkretni elementi medsebojnega poznavanja: Statisticni atlas predstavlja pripomocek pri teh prizadevanjih.

Giancarlo Galan

Predsednik regije Veneto in
predsedujoci Delovne skupnosti Alpe-Jadran

Benetke, 19. novembra 2002

Foreword

The Alps-Adria Working Community is close to celebrating its 25th anniversary and feels the need to update its long-term co-operation objectives. That is why - during its two-year presidency - the Veneto Region has prepared the *Alps-Adria Guidelines in the Europe beyond the year 2000*.

At the crossroads of European integration the Alps-Adriatic Regions are an extraordinary meeting place of peoples, languages, cultures and communities committed to proceed in the European Union path through the improvement of their economic and social cohesion.

This Statistical Atlas records the diversity and the multiplicity of circumstances in Alps-Adria with the most recently available data.

The Regions and the institutions making up the Community wish to reduce imbalances and inequalities aiming at more homogeneous standards of living.

Pursuing these objectives needs concrete evidence: the Statistical Atlas offers invaluable support to such commitment.

Giancarlo Galan

President of the Veneto Region
and of the Alps-Adria Community

Venice, 19th November 2002

Nota Metodologica

Obiettivo dello studio è rispondere alle esigenze conoscitive della Comunità di lavoro Alpe Adria sulle analogie, le omogeneità, le differenze e le specificità delle regioni che la compongono. La ricerca dei dati statistici, la scelta degli indicatori e la definizione della metodologia impiegata sono state effettuate dall'Unità di Progetto Statistica della Regione Veneto, utilizzando la produzione statistica delle seguenti fonti:

1. Uffici di statistica nazionali e comunitario (Eurostat)
2. Uffici di statistica regionali
3. Altri enti amministrativi

Lo studio è nato da un'iniziativa della Regione Veneto e, anche se non si è costituito un formale tavolo di lavoro, tutte le regioni di Alpe Adria hanno contribuito alla sua realizzazione mediante la fornitura di materiale statistico, la revisione, la correzione e l'aggiornamento delle tabelle statistiche predisposte. Un prezioso aiuto è stato fornito dall'Ustat (Canton Ticino), Crostat (Croazia), dall'NSO (Slovenia), dai dipartimenti statistici dell'Alta Austria, Burgenland, Carinzia e della Stiria, dal KSH della contea di Baranya, referente per le cinque contee ungheresi, dal dipartimento di statistica della Baviera, dagli uffici di statistica del Friuli Venezia Giulia, della Lombardia e delle province autonome di Trento e di Bolzano.

La pubblicazione si compone di undici capitoli, ciascuno dei quali corredata di note e definizioni necessarie a verificare la confrontabilità delle informazioni statistiche. Non sempre è stato possibile analizzare particolari fenomeni a causa dell'eccessiva eterogeneità dei dati delle diverse regioni, per questo motivo alcuni argomenti risultano meno ricchi rispetto ad altri o sono rimasti completamente esclusi dalla pubblicazione quale, ad esempio, l'ambiente.

Ogni capitolo, oltre ai dati numerici, riporta grafici e mappe per una lettura più immediata dei fenomeni presi in esame.

Si ritiene che lo studio effettuato possa considerarsi il primo tassello di un processo di costruzione di statistiche comparative regionali oltre frontiera e si auspica che sia da stimolo, per tutti i soggetti coinvolti, per una maggiore attenzione alla problematica della confrontabilità e reperibilità delle statistiche interregionali.

Il Dirigente Regionale dell'Unità di Progetto Statistica

Methodologische Hinweise

Zweck der vorliegenden Studie ist es den Kenntnisstand über die Gemeinsamkeiten sowie Unterschiede und Besonderheiten der Mitgliedsregionen innerhalb der Arbeitsgemeinschaft Alpen-Adria zu verbessern. Die Datenerhebung, die Auswahl der Indikatoren und die Festlegung der methodologischen Vorgangsweise erfolgte durch die Unità di Progetto Statistica der Region Venetien, die vor allem auf drei Datenquellen zurückgreifen konnte:

1. Nationale und supranationale Statistikämter (Eurostat)
2. Regionale Statistikämter
3. Andere Verwaltungsstellen

Die vorliegende Studie entspringt einer Initiative der Region Venetien und, obwohl es sich nicht um ein formelles Projekt handelte, haben alle Alpen-Adria-Regionen einen Beitrag zu ihrer Realisierung geleistet. So waren sie bei der Überprüfung, Korrektur und Aktualisierung der erhobenen Daten behilflich. Einen maßgeblichen Beitrag leisteten insbesondere Ustat (Kanton Tessin), Crostat (Kroatien), NSO (Slowenien), die Statistikabteilungen der Länder Oberösterreich, Burgenland, Kärnten und Steiermark und das KSH des Komitats Baranya (stellvertretend für die fünf ungarischen Komitate), das Bayerische Statistikamt, die Statistikabteilungen der Regionen Friaul-Julisch Venetien und Lombardei sowie der Autonomen Provinzen Trient und Bozen.

Die Publikation besteht aus elf Kapiteln, von welchen jedes einzelne mit Fußnoten, Anmerkungen und Definitionen versehen ist, um die Vergleichbarkeit der statistischen Daten zu gewährleisten. Es war nicht in allen Fällen möglich auf die Besonderheiten der einzelnen Regionen einzugehen; daher wurden die einzelnen Themenbereiche mit einem sehr unterschiedlichen Detailgrad behandelt und einige mussten sogar völlig aus der Publikation ausgeschlossen werden, wie z.B. das Thema Umwelt.

Zudem wurden Graphiken und Karten angefügt, die einen unmittelbaren Überblick über die dargestellten Phänomene liefern.

Diese Studie kann als ein erster Schritt hin zu der Erstellung vergleichbarer, grenzüberschreitender regionaler Statistiken gelten und wir hoffen, dass sie einen Anreiz für alle Betroffenen darstellt, sich in verstärktem Maß mit der Problematik der Vergleichbarkeit und der Verfügbarkeit statistischen Datenmaterials zu befassen.

Der regionale Leiter der Unità di Progetto Statistica

Metodološka Bilješka

Cilj je ove studije odgovoriti na potrebe RZ Alpe-Jadran za stjecanje informacija o analogijama, podudarnostima, razlikama te posebnostima clanica. Istraživanje statistickih podataka, odabir pokazatelja i definiranje korištene metodologije obavio je Projektni odjel za statistiku regije Veneto, služeci se statistickom produkcijom iz sljedecih izvora:

1. Nacionalnih ureda za statistiku i europskog ureda (Eurostat)
2. Regionalnih Odjela za statistiku
3. Drugih upravnih odjela

Studija je pokrenuta temeljem inicijative regije Veneto a, premda nije osnovana formalna radna skupina, sve su clanice RZ Alpe-Jadran pridonijele njezinoj izradi tako što su nam dostavile statisticko gradivo, te provele reviziju, korekciju i ažuriranje pripremljenih statistickih tablica. Dragocjena nam je pomoc došla iz Ustat-a (kanton Ticino), Crostat-a (Hrvatska), NSO-a (Slovenija), te iz statistickih odjela Gornje Austrije, Gradišca, Koruške i Štajerske i KHS-a županije Baranya, koja je djelovala kao povjerenik za pet madarskih županija, iz Odjela za statistiku Bavarske, iz ureda za statistiku Furlanije-Juliske krajine, Lombardije i autonomnih provincija Trento i Bolzano.

Ova se publikacija sastoji od jedanaest poglavlja, od kojih je svako opremljeno bilješkama i definicijama neophodnim za provjeru usporedivosti statistickih informacija. Nismo uvijek bili u mogucnosti analizirati pojedinacne pojave uslijed previleike raznorodnosti podataka iz raznih clanica, te su iz tog razloga poneke tematike manje obilno obradene nego druge a poneke su cak potpuno iskljucene iz publikacije poput, primjerice, okoliša.

Svako poglavje, osim numerickih podataka, sadrži grafikone i mape radi što pregleđnjeg i neposrednjeg uvida u promatrane pojave.

Smatramo kako provedena studija može predstavljati prvi korak u procesu izrade prekograničnih regionalnih komparativnih statistika, te se nadamo da ce poslužiti kao poticaj svim sudionicima da obrate vecu pozornost pitanjima usporedivosti i dostupnosti regionalnih statistika.

Regionalni nacelnik Projektnog odjela za statistiku

Módszertani Megjegyzés

A tanulmány célja az Alpok-Adria Munkaközösség információ-igényét kielégíteni, az azt alkotó régiók analógiái, különbségei, homogenitása és sajátos tulajdonságai tekintetében. A statisztikai adatok felkutatását, valamint az alkalmazott módszertan kiválasztását Veneto Tartomány Statisztikai Projekt-egysége végezte, az alábbi statisztikai forrásokból merítve:

1. Nemzeti és közösségi statisztikai hivatalok (Eurostat)
2. Regionális statisztikai hivatalok
3. Egyéb közigazgatási intézmények

A tanulmány Veneto Tartomány kezdeményezése alapján indult el és ugyan nem alakult formális munkacsoport, mégis minden Alpok-Adria Tartomány részt vett megvalósításában, statisztikai adatok szolgáltatásával, az elkészített táblázatok áttekintésével és frissítésével. Igen értékes segítséget nyújtottak: Ustat (Ticino Kanton), Crostat (Horvátország), NSO (Szlovénia), valamint Felső Ausztria, Burgenland, Karintia és Steyrmak statisztikai igazgatóságai, továbbá a Baranya megyei KSH, mely az öt magyar megye tekintetében vállalt referens szerepet, a Bajor Statisztikai Igazgatóság, továbbá Friuli Venezia Giulia és Lombardia tartományi, valamint Trento illetve Bolzánó provinciális statisztikai hivatalai.

A kiadvány tizenegy fejezetből áll, minden egyes fejezetet tartalmaz grafikonokat, térképeket a vizsgált jelenségek közvetlenebb olvasata érdekében, hogy a statisztikai adatok összefethetősége megállapítható legyen. Nem minden esetben vált lehetséges egyes jelenségek elemzése az egyes régióból származó adatok túlzott heterogén mivolta miatt, épp ezért egyes téma-k talán kevésbé kidolgozottnak tunhetnek, másokhoz képest, vagy egyenesen kimaradtak a kiadványból, mint például a környezetre vonatkozó.

A számadatokon túl, minden egyes fejezet tartalmaz grafikonokat, térképeket a vizsgált jelenségek közvetlenebb olvasata érdekében.

Úgy véljük, az elvégzett munka elso mozaikköve lehet egy, a határokon átnyúló, összehasonlító regionális statisztikákat kialakító folyamatnak, bízva abban, hogy ösztönzzen hathat az összes résztvevo szakember irányában, annak érdekében, hogy nagyobb figyelemmel legyenek az interregionális statisztikák összefethetőségére, illetve fellehetőségére.

A Statisztikai Projekt Egység Tartományi Vezetője

Metodološka opomba

Cilj študije je, da bi se odzvali na potrebe po poznavanju Delovne skupnosti Alpe-Jadran glede analogij, homogenosti, razlik in specificnosti clanic, ki jo sestavljajo. Proucitev statističnih podatkov, izbor kazalcev in dolocitev metodologije je opravila Projektna enota za statistiko regije Veneto, ki je pri tem uporabila statistično gradivo iz naslednjih virov:

1. nacionalnih uradov in uradov Evropske unije za statistiko (Eurostat),
2. statističnih uradov clanic,
3. drugih upravnih ustanov.

Študija je nastala na pobudo regije Veneto, in ceprav v ta namen ni bila ustanovljena formalno delovno omizje, so k realizaciji pobjude prispevale vse clanice DS Alpe-Jadran z zagotavljanjem statističnega gradiva, z revizijo, pregledom in ažuriranjem pripravljenih statističnih tabel. Dragoceno pomoc so zagotovili Ustat (Kanton Ticino), Crostat (Hrvaška), NSO Statistični urad Republike Slovenije, oddelki za statistiko Gornje Avstrije, Gradiščanskega, Koroške in Štajerske, KHS županije Baranya v imenu petih madžarskih županij, oddelek za statistiko Bavarske in statistični uradi Furlanije-Julisce krajine, Lombardije ter avtonomnih pokrajin Trento in Bolzano/Bozen.

Publikacijo sestavlja enajst poglavij, ki so opremljena z opombami in definicijami, potrebnimi za preverjanje primerljivosti statističnih informacij. Zaradi prevelike heterogenosti podatkov med različnimi clanicami v nekaterih primerih ni bilo mogoče analizirati posebnosti, zato so nekatera področja obdelana manj kot druga ali pa so v celoti izpuščena iz publikacije, na primer področje okolja.

Vsako poglavje vsebuje poleg numericnih podatkov tudi grafe in karte za cim bolj neposredno odcitavanje obravnavanih pojavov.

Študija naj bi predstavljala prvi korak v procesu oblikovanja primerljivih statistik clanic, segajocih preko meja, težila pa naj bi k spodbujanju vseh sodelujocih subjektov k temu, da bi posvečali večjo pozornost problematiki primerljivosti in dostopnosti medregionalnih statistik.

Regijski vodja Projektne enote za statistiko

Methodological Note

The main purpose of this study is meeting the Alps Adriatic Working Community's needs of learning about the analogies, homogeneities, differences and specificities of the various regions the Community is made up of. The search for statistical data, the choice of the indicators used and the definition of the employed methodology have been carried out by Unità di Progetto Statistica (the Statistics Unit) of the Veneto Region, by using statistical data of the following sources:

1. National and EU statistical Offices (Eurostat)
2. Regional statistical Offices
3. Other administrative bodies

This study is an initiative promoted by the Veneto Region and - even though a formal board has never been set up - all Alps-Adriatic regions have contributed to its realization, by providing us with statistical material and by attending to the revision, correction and updating of the statistical tables we have made.

A precious help has been given by Ustat (Ticino), Crostat (Hrvatska), NSO (Slovenija), by the statistical departments of Oberösterreich, Burgenland, Kärnten and Steiermark, as well as by KSH of Baranya County, which was our "provider" on behalf of the five Hungarian counties, by the statistical department of Bayern and by the statistical offices of Friuli Venezia Giulia, Lombardia and of the autonomous provinces of Trento and Bozen.

The publication consists of eleven chapters and each one has the necessary notes and definitions enabling the comparability of statistical information. It was not always possible to analyse certain phenomena, because of the excessive data heterogeneity of the various regions; on this account some topics result to be less rich in comparison to others or have been totally excluded from publishing, such as environment, for instance.

Each chapter contains not only statistical figures, but also graphs and maps aimed at a quicker comprehension of the phenomena taken into consideration.

We think that this research work can be considered a first step in a process of elaboration of regional statistical data that can be finally compared with the corresponding data of regions belonging to other countries and we also expect this work to be a sort of incentive, for all the regions and statistical offices involved, to pay more attention to the problems of comparability and availability of interregional statistical data.

The Chief of the Regional Statistics Unit

Population

2

In the period between 1994 and 2000 the resident population appears to be increased in Ticino, in the Italian regions except for Friuli-Venezia Giulia, in Bayern, in Burgenland, in Kärnten and in the Hungarian county of Györ-Moson-Sopron. In the other regions, the total of the resident population decreases by a percentage lesser than 1%, apart from Steiermark, Vas, Zala and Croatia where there have been percentage reductions exceeding 1%, up to the 4,6% in Croatia. The number of inhabitants in Slovenia is almost stationary. Aside from variations in the total of the population, we can infer that the Hungarian counties, Croatia, Slovenia, Kärnten and Oberösterreich have younger populations compared to the other Alps Adriatic regions. As a matter of fact, their old-age dependency ratio, which shows the percentage incidence of elderly people (65 and over) on young people (0-14 years old), is lesser than 100, unlike other regions - such as Lombardia, Friuli-Venezia Giulia and Veneto - where this indicator reaches values substantially exceeding 100. What has just been said is supported by the fact that in the so-called younger regions the population in the age group 15-24 covers a 14-15% of the total population against the 10-11% in the remaining regions. Also in the age group 5-14 the population percentage reaches a value of 6% against the 4-5% in the Italian regions for example.

With regard to birthrates, the lowest rates concentrate in Burgenland, Vas, Zala and Friuli-Venezia Giulia, where the value of this indicator is 8 births per 1.000 inhabitants. The highest rate can be found in Trentino-Alto Adige where it reaches the value of 11 births per 1.000 inhabitants. On the contrary, the highest deathrates can be found in the Hungarian counties as well as in Friuli-Venezia Giulia, with 12-15 deceases per 1.000 inhabitants. The lowest death-rates are recorded instead in Oberösterreich (8,6) and in Trentino-Alto Adige (8,7).

2

Methodological Note

Resident population

The resident population is made up of the people of both autochthonous and foreign citizenship usually living on the national territory, even though they are temporarily away.

For Ticino we speak of legal permanent population made up of Swiss, resident foreigners, staying people, international officials or claimers for asylum legally domiciled in a municipality in Ticino.

Live births

Definition

By the concept live birth we intend any new-born child showing whatever sign of life, breathing, heart-beat or movement of voluntary muscles.

The data drawn from Eurostat refer to births from mothers living on the territory of competence which also took place on that territory. Births from mothers living on a certain territory which took place out of it are excluded.

The data for Croatia beginning from 1998 are consistent with Eurostat definition, whereas until 1997 these data refer to births from mothers living in the Country, regardless of whether they took place on the territory or out of it.

For Ticino and Switzerland we refer to happy events related to the legal permanent population and births are ascribed to the municipalities where mothers are domiciled.

Sources:

For EU states and regions the source of data is Eurostat until 1999. For Germany the source of data related to 1999 and 2000 is Destatis, for Austria the source of data related to 2000 is Statistik Austria; for Italy data of the year 2000 make reference to Istat; for Slovenia and Croatia data which cover the whole period from 1995 to 2000 are drawn from the Federal Office of Statistics of the Slovenian republic and from Crostat respectively; as for Switzerland and Ticino their sources of data are Ust and Ustat; Hungarian counties have drawn their data for 2000 from Ksh.

Deaths

Data taken from Eurostat refer to deceases of persons living on the territory which also took place on it. Deceases related to persons living on the territory which took place out of it are excluded.

The data for Croatia beginning from 1998 are consistent with Eurostat definition, whereas until 1997 these data refer to the total of deceases related to people living on the territory, regardless of where (on the territory of competence or out of it) the occurrences took place.

For Ticino and Switzerland we refer to occurrences related to the legal permanent population and deceases are ascribed to the municipality where the dead person was domiciled.

Sources:

For EU states and regions the source of data is Eurostat until 1999. For Germany the source of data related to 1999 and 2000 is Destatis, for Austria the source of data related to 2000 is Statistik Austria; for Italy data of the year 2000 make reference to Istat; for Slovenia and Croatia data which cover the whole period from 1995 to 2000 are drawn from the Federal Office of Statistics of the Slovenian republic and from Crostat respectively; as for Switzerland and Ticino their sources of data are Ust and Ustat; Hungarian counties have drawn their data for 2000 from Ksh.

Health Care

In all Countries and regions the largest number of deceases is due to diseases of the cardiovascular system. Neoplasms represent the second cause of death, whereas diseases of the respiratory system – apart from Hungary – represent the third cause of death. Hungary and its counties differ from all other Countries in that their third cause of death is represented by diseases of the digestive system.

The death rate for diseases of the cardiovascular system is higher in women than in men – apart from Ticino and Györ-Moson-Sopron. This difference between sexes is more pronounced in Germany, Austria, Steiermark, Bayern and Friuli Venezia Giulia, whereas in Baranya, Hungary and Vas the incidence rates between the two sexes with reference to this cause of death are fairly similar.

Vice versa, the death rate for neoplasm is higher in men than in women, with more pronounced differences to be found in Hungary and its counties, Veneto, Friuli Venezia- Giulia, Italy, and Croatia, and lesser differences in Oberösterreich, Austria, Steiermark, Germany as well as Bayern.

By comparing the data of the various regions referred to the latest available year, we can find out that for both sexes the death rate for diseases of the cardiovascular system varies quite a lot from region to region. As for men, the death rate shifts from the lowest value of around 330 deceases per 100.000 inhabitants in Switzerland to a highest value of 760 in Zala (Hungary). As for women the death rate shifts from the lowest value of 380 deaths per 100.000 inhabitants in Switzerland to a highest value of 840 always in Zala. Both for men and women the highest values of the incidence rate related to this cause of death can be found at a great extent in Hungary and its counties (always above 640 deceases per 100.000 inhabitants for both sexes). The death rate for neoplasm, the second cause of death, instead shows more moderate variations: for men it shifts from a lowest value of about 227 (Oberösterreich) to fast 430 (Friuli Venezia-Giulia) deceases per 100.000 inhabitants, whereas for women the death rate shifts from 183 (Switzerland) to over 314 (Friuli Venezia-Giulia) deceases per 100.000 inhabitants. Also for neoplasms and for both sexes, Hungary and in general its counties stand out for pretty high values of the death rate, which are not much inferior to the highest value recorded in Friuli Venezia-Giulia.

3

Methodological Note

The causes of death are defined according to the International Classification of Diseases (ICD).

Beginning from 1996, with the exception of data referred to Italy and Osterreich, deceases are codified according to the tenth version of the classification of death causes. As for Italy and the Italian regions here considered, on the tables you can find the data published by Istituto Superiore di Sanità (Rome), as they are more up-to-date, although they are still classified according to the ninth version of ICD, which is the prior version to the one used by the other Countries. Also the data prior to 1996, with the exception of Switzerland and Ticino, still make reference to the ninth version of the classification of death causes.

Death rates reported on table 3.2 are crude death rates per 100.0000 inhabitants and they are calculated being inevitably affected both by the population structure by age as well as by mortality. For a correct comparison between different countries and years, it would be necessary to use standardized death rates, in order to eliminate the influence exerted by the population structure by age and to consider the only effect of mortality. However, at the moment, standardized rates for all the Alps Adriatic regions with the same population of reference are not available.

In the end, it is to be specified that for each Country and region the latest data are reported on the tables. In particular, with regard to the absolute number of deceases (tab. 3.1), the datum for Ticino refers to the year 1996, for Italy to the year 1998, for Slovenia, Hrvatska and Osterreich the year 2000 and for the remaining regions or Countries to the year 1997. As for the death rate, the data refer for Slovenia to the year 2000, for Croatia to the year 1999, for Italy and Osterreich to the year 1998 and for the remaining regions to the year 1997.

Sources

Slovenia's data have been provided by the Statistics Office of the Slovenian Republic, Croatia's data are drawn from Crostat, Ticino's from Ustat, whereas for Italy they are taken from Istituto Superiore di Sanità (Rome), for Hungary from Ksh, for Osterreich from Oberösterreich Statistical Department and for the remaining regions and Countries they are drawn from Eurostat.

Transport infrastructure and mobility

The road network in the period from 1996 to 2000 remained almost unchanged, with the exception of Slovenia, where there was quite an increase, from the 14.869 km of 1996 to the 20.177 km of 2000.

Oberösterreich and Somogy are the two regions marked respectively by the highest and the lowest "density" of roads, which is the ratio of road network length to the region's area. The highest and the lowest number of roads km per inhabitant can be found instead in Oberösterreich and Bayern respectively.

Also the railway network in the period from 1996 to 2000 did not undergo any changes either: the available data show that Györ-Moson-Sopron and Trentino-Alto Adige are the regions with the highest and lowest density respectively, whereas Somogy and Lombardia are the regions with the highest and lowest "number of railway km. per inhabitant" respectively.

With regard to road vehicles, basically we can notice a steady increase principally in the number of private vehicles and, in some cases, also in the number of large vehicles.

The highest traffic intensity on roads is recorded in Bayern for the categories "Private vehicles" and "Large vehicles", in Baranya for the category "Buses"; the lowest intensity, instead, is recorded in Oberösterreich for both categories "Private vehicles" and "Buses" and in Slovenia for the category "Large vehicles".

If we consider the traffic situation on its whole, the greatest stream of traffic can be found in Bayern, whereas the lowest one is recorded in Oberösterreich.

The number of vehicles per 1.000 inhabitants varies from a minimum of 274.11 in Croatia to a maximum of 811.90 in Kärnten, with the greatest differences among the various regions to be found for the category "Private vehicles".

Closely connected to the traffic is certainly the issue of road accidents: in Bayern we can find both the greatest number of road accidents and the highest ratio of road accidents to the road network length.

The inhabitants of Oberösterreich are the most "exposed" to the risk of road accidents, whereas the inhabitants of Somogy are the least exposed ones.

The number of casualties for road accidents in the period 1995:2000 shows different and non-continuous trends.

The biggest number of casualties per road vehicles can be found in Somogy, the lowest number in Kärnten.

In the end, data concerning air transport of goods and passengers mostly show increasing trends in the period 1996:2000.

4

Methodological Note

The statistics on transport are drawn for the most part from Eurostat. Data collecting procedures on the international level have been standardized following the directions provided by the Working Group instituted by Eurostat, ECMT (European Council of Ministers of Transport) and UN/ECE (United Nations – Economic Commissions for Europe). The obtained result has been a common glossary of standard terms regarding infrastructures, transport equipment, traffic, transport measurement, as well as the energy consumption in the sectors of road, rail, maritime and inland waterway transport.

Infrastructures

The first set of tables gives the regional breakdown of certain general data on transport:

- the data on transport networks indicate the length of roads and railways.

By the term "road" we mean a line of communication (travelled way) using a stabilized base other than rails or air strips open to public traffic, primarily for the use of road motor vehicles running on their own wheels.

By the term "railway" we mean a line of communication made up by rail exclusively for the use of railway vehicles.

- Vehicle numbers include motor cars (vehicles with seats for a maximum of nine persons, including the driver), buses (vehicles with seats for ten or more persons) and large vehicles (goods carriage vehicles, road tractors, trailer and semi-trailers).

Road safety

The statistics on road accidents refer to all accidents which took place on a public travelled way causing injuries to persons.

The statistics on road safety include all victims of road accidents: cyclists, motorcyclists, car drivers and passengers, etc.

With regard to casualties in road accidents, there are some significant differences in the period taken into account after the accident. The 30 days international norm defined by the ECTM (European Conference of Transport Ministers - an OECD organisation) is applied by all the Member States except GR (period of 3 days), ES (period of 24 hours, up to and including 1993), FR (period of 6 days), IT (period of 7 days), AT (period of 3 days, up to 1991), PT (deaths at the scene of the accident or during the journey to hospital). Deaths happening after these periods are recorded as "injured".

Air transport

The data on air transport refer to domestic and foreign traffic. Traffic at the minor ports and airports may be included only in the totals for the country.

Passengers changing aircraft in an airport in the region are counted twice (once on arrival and again on departure), whereas passengers continuing their journey in the same aircraft from the reporting airport are counted only once as transit passengers. If they are available, the corresponding figures are given for freight and mail, including express parcels and diplomatic bags, but not passengers' and aircrew's luggage.

Labour

Analysing the labour market is certainly one of the most appropriate ways to judge the economy of a country. From 1998 to 2000 employment in the Alps-Adriatic Regions improved with the exception of Slovenia and Croatia which recorded a negative trend (around - 1.5 %). In the same period, the number of unemployed persons in Alps-Adria diminished everywhere apart from Burgenland (+ 3.2 %). The number of unemployed persons of Zala halved. Italian Regions record the lowest percentage of women over the entire working population (38.8 % in Veneto in the year 2000) and the highest percentage of women over the entire unemployed population (72.6 % in Friuli Venezia-Giulia in the year 2000). The difference in the employment rate of men and women is greatest in Veneto. The employment rate for both men and women is highest in Canton Ticino (89.7 % and 70.7 % respectively). The greatest difference in the employment rate in the various economic sectors is recorded in Canton Ticino (agriculture-forestry-fishing 2.1%; industry 26.6 %; services 71.3 %).

5

Methodological Note

Labour force: The labour force comprises persons in employment and unemployed persons (Eurostat)

Persons in employment: persons in employment are those who during the reference week did any work for pay or profit, or were not working but had jobs from which they were temporarily absent. (Eurostat)

Unemployed persons: unemployed persons comprise all persons of and above 15 years of age who during the reference period were:

without work;
available for paid employment or self-employment in the following two weeks;
"seeking" work (Eurostat)

Unemployment absolute data are the result of the difference between labour force and persons in employment.

Employment rate: the employment rate represent persons in employment as a percentage of the total working-age population (persons in employment/ population of the 15-64 age group) *100. (Eurostat)

Unemployment rate: unemployment rate represents unemployed persons as a percentage of the labour force (unemployed persons/labour force)*100. (Eurostat)

Sources:

Eurostat for EU Regions and States, Switzerland, Hungary and Slovenia; Ustat for Canton Ticino; Ksh for Hungarian Counties; Crostat for Croatia. Unemployment rate (Table 5.3) is provided by Eurostat except for Italy (ISTAT), Switzerland and Canton Ticino (Bak).

Eurostat data refer to the second quarter of the year except for Austria (first quarter).

Absolute data for Canton Ticino (Source: Ustat) refer to the 1990 population census because the survey on the labour force provides only figures at national level.

Croatia employment data comes from two different sources: the Survey on the Labour Force for persons in paid employment and the Health Insurance Institute for self-employed persons (artisans, tradesmen, shopkeepers, professionals).

Agriculture

6

Despite in the tables of this chapter analysing the agriculture sector there are several data not available, it is however possible to make a few remarks concerning the agricultural situation of the regions belonging to Alps Adria.

In the first place, table 6.1 shows how the Hungarian counties have the highest percentage of utilized agricultural area with respect to their whole territory (Györ-Moson-Sopron 67,5% , Baranya 62,5%).

The region where this percentage is lowest is Ticino, with only 14,3% of utilized agricultural area.

With regard to the land devoted to the production of herbaceous products, tables 6.2 and 6.3 show how for the whole Alps Adriatic area soft and durum wheat and spelt and grain maize cover the main part of present cultivations, with the only exception of Veneto, where the cultivations of soybean and sugar beet play an important part.

In the end, table 6.4 shows how the livestock of the area in question consists to a great extent of cattle and pigs.

6

Methodological Note

Land use: The occasional minor differences between national and regional statistics are due to the fact that certain areas that are not recorded in the course of agricultural surveys are estimated at national level but cannot be regionalized with the same accuracy.

Utilised agricultural area: the Utilised_agricultural_area means the total area used for crop production, which is exhaustively described as: arable land including temporary grassing and fallow and green manure, permanent grassland, land under permanent crops (e.g. fruit and grapes), crops under glass and other utilised agricultural areas.

Arable land: is land worked regularly, generally under a system of crop rotation, which includes fallow land.

Wooded area: this consists of forest area and other wooded areas.

Industry and Energy

7

The structure analysis of the industry sector highlights how the greatest number of local units for all Alps-Adriatic regions is involved in trade activities. Unfortunately the coverage of the whole Working Community is not complete. Moreover, for Bayern a strong lack of homogeneity is to be pointed out, due to the absence of coverage of small enterprises (see methodological note).

On the contrary, the number of persons employed is bigger in manufacturing industries, whereas second ranked are the employees in the trade activities sector.

With regard to the size of enterprises, apart from Bayern, data show that the average size of them is pretty diversified. For instance, in the manufacturing activities sector the number of employees per local unit varies from 6.4 of Baranya to 26 of Oberösterreich.

In the trade activities sector the number of employees per local unit varies again from 0.5 of Zala, Baranya and Somogy counties to 6.3 of Steiermark and 7.4 of Oberösterreich.

The largest producer of electric energy is Bayern, followed by Lombardia and Veneto. The sector consuming most energy is industry, whereas the region with the highest power consumption per inhabitant is Ticino.

7

Methodological Note

Local unit is an enterprise or part thereof (e.g. a workshop, factory, warehouse, office, mine or depot) producing goods or services. The local unit is situated in a geographically identified place. At or from this place economic activity is carried out for which – save for certain exceptions – one or more persons work for one and the same enterprise.

A count of the number of local units registered to the population concerned in the business register corrected for errors, in particular frame errors. Local units must be included even if they have no paid employees. This statistic should include all units active during at least a part of the reference period. (Eurostat)

The number of **persons employed** is defined as the total number of persons who work in the observation unit. (Eurostat)

It's important to underline that in Germany and Bayern the statistical surveys in the production industries generally cover only local units of enterprises (in the sectors mining and quarrying, manufacturing, energy supply and construction) employing 20 or more persons. This fact affects remarkably the comparison with the other territories considered.

The source of data related to the industry sector for the regions and states belonging to EU is Eurostat, whereas for Ticino the data source is Ustat.

The data on the gross production of energy published on GRTN that are not related to Italy or the Italian regions are expressed in TWh. The conversion into GWh has been made; therefore some slight distortions of these data can be found.

This chapter looks at tourism in the Alps-Adria Community.

Table 8.1 reports the number of accommodation establishments and of bedplaces in the year 2000. It is worth noting how in the former only Veneto and Trentino-Alto Adige have a greater number of non-hotel accommodation than hotels proper.

As for bedplaces the picture is not as clear-cut with each of the two categories leading in different regions.

Tourist arrivals per accommodation establishment in the year 2000 are reported in Table 8.2. Bayern takes the leading position in the overall number of arrivals followed by Veneto and Lombardia. Arrivals in hotels are greater than in the rest of non-hotel accommodation.

The following Table (8.3) shows tourist arrivals in the period 1996-2000. Arrivals in Alps-Adria Community have kept increasing over the years. Domestic tourism prevails over foreign tourism. As for the latter a slight decrease in the year 1999 is recorded which was more than compensated by increased domestic arrivals. The prevailing foreign component in the figures of Hrvatska is worth mentioning. Eight Regions/States (among them Bayern, Veneto and Steiermark) have always maintained an upward trend in the number of arrivals.

Tables 8.4 shows the number of tourist overnight stays in different kinds of accommodation while Table 8.5 reports overnight stays in the period 1996-2000. Bayern, Veneto and Hrvatska are leaders in the overall number of overnight stays.

Over the entire period the trend is positive in all the regions of the Alps Adria Community except for a minor decrease in Lombardia and Karnten.

In the non-hotel type of accommodation, camping-sites in Veneto and Hrvatska - which are much appreciated by foreign tourists - take a prominent position.

Finally, Table 8.6 reports the major tourism indicators: average stay (Hrvatska, Trentino-Alto Adige and Veneto taking the lead); accommodation rate (Trentino-Alto Adige, Karnten and Hrvatska with the best ranking); tourism orientation rate (overnight stays over population) with Trentino-Alto Adige, Karnten and Veneto as leaders.

Tourist accommodation: any facility that regularly or occasionally provides overnight accommodation for tourists.

Hotels and similar establishments: hotels and similar establishments are typified as being arranged in rooms, in number exceeding a specified minimum; as coming under a common management; as providing certain services including room service, daily bed-making and cleaning of sanitary facilities; as grouped in classes and categories according to the facilities and services provided; and as not falling in the category of specialised establishments.

Other collective establishments and Specialised establishments: any establishment, intended for tourists, which may be non-profit making, coming under a common management, providing minimum common services (not including daily bed-making) and not necessarily being arranged in rooms but perhaps in dwelling-type units, campsites or collective dormitories and often engaging in some activity besides the provision of accommodation, such as health care, social welfare or transport.

Capacity of collective tourist accommodation: local units on national territory

Number of establishments: the local unit is an enterprise or part thereof situated in a geographically identified place. At or from this place economic activity is carried out for which - save for certain exceptions - one or more persons work (even if only part-time) for one and the same enterprise.

The accommodation establishment conforms to the definition of local unit as the production unit.

Number of bedplaces: the number of bedplaces in an establishment or dwelling is determined by the number of persons who can stay overnight in the beds set up in the establishment (dwelling), ignoring any extra beds that may be set up by customer request.

The term bedplace applies to a single bed, double bed being counted as two bedplaces.

Arrivals of residents and non-residents: an arrival (departure) is defined as a person who arrives at (leaves) a collective accommodation establishment or at private tourism accommodation and checks in (out).

Nights spent by residents and non-residents: a night spent (or overnight stay) is each night that a guest actually spends (sleeps or stays) or is registered (his/her physical presence there being unnecessary) in a collective accommodation establishment or in private tourism accommodation.

Overnight stays are calculated by country of residence of the guest and by month.

Average Stay = number of overnight stays/number of arrivals

Accommodation Rate = (Bed places/population)*100

Tourism Orientation Rate = ((Overnight stays/365)/population) *1000

(a) Data not available

(a) Includes all rented accommodation managed on a profit-making basis (and not just establishments registered at the Chamber of Commerce Registrar as it was the case until 1999). Consequently the main types of accommodation are: holiday dwellings, boarding houses, B&B, accommodation establishments ancillary to restaurants, furnished apartments, houses, chalets and other dwellings rented as tourist accommodation.

Foreign trade

The importance of statistics on foreign trade is vital as they represent a fundamental tool for both private and public organisations. They are used, for example, to prepare negotiation talks on common trade policies or they may help businesses judge their competitiveness.

The Alps-Adria regions show remarkable differences both in the quantity and in the trend of their balance of trade.

In absolute terms, Bavaria and Lombardy are the Regions/States boasting the most exports in the year 2000 with Bavaria showing the best trade surplus.

However the standardised trade balance which represents the trade balance over the volume of trade shows Friuli Venezia Giulia ranking first followed by the Hungarian Counties of Zala and Györ-Moson-Sopron and by Veneto.

As to the *per capita* exports, the Györ-Moson-Sopron County takes the lead followed at a distance by Canton Ticino, Vas and Veneto.

The exports trend between 1995 and 2000(current values) indicates a sharp increase for Friuli Venezia Giulia (53,2%), followed by Veneto (51%), Slovenia (49%) and Croatia (39%).

External trade statistics are usually recorded on the basis of customs declarations submitted by the declarant when clearing customs. With the introduction of the Single Market on 1 January 1993 and the abolition of customs formalities between the Member States, the traditional source of trade statistics, came the introduction of a special collection system called INTRASTAT.

Data refer only to trade in goods with foreign countries. Some discrepancies on data attribution imply a lack of homogeneity which has been diminishing over time as compliance to recommendations and international regulations (by the United Nations and the European Union) has improved.

Imports refer to all goods imported from abroad for final consumption in a given region. In accordance with international agreements the value of imports includes Cost, Insurance and Freight (CIF) up to the national border.

Exports refer to all goods manufactured or on sale in a given region and exported to a foreign country. In compliance with international agreements the value of exports is an FOB value (in this case Free at the country's border).

The trade balance is defined as the difference between exports and imports.

The standardised trade balance is the value of the trade balance divided by the volume of transactions (exports + imports). The figure thus obtained ranges from -1 to 1. It would be 1 unrealistically assuming that a region would only export goods without importing any. Conversely it would be -1 assuming that a region would only import goods without exporting any. If the value of exports would exactly match the value of imports the Standardised trade balance would be 0.

Per capita exports is the value of exports divided by the population.

Exchange rates of national currencies or the US dollar against the ECU or EURO are taken from the:

- *Eurostat Yearbook 2002*, p. 408, published by Eurostat;
- *New Cronos data base*;
- magazine *Money and Finance* n. 3 - 2002.

Since 1 January 1999 the parity between ECU and EURO is equal to 1.

* Data for Bayern, Lombardia and hungarian counties refer to 1999

Source: data processing by the Veneto region based on data by: Crostat, Eurostat, Istat, Hungarian Ministry for Economic Affairs, Autonomous Province of Bolzano, Autonomous Province of Trento, Regione Friuli Venezia Giulia, Lombardy Region, Bavarian Office for Statistics and data processing, NSO, for Switzerland and Ticino source Swissimpex, processing by Ustat

Gross Domestic Product

The GDP of the Alps-Adria Community as Purchasing Power Standards (PPS) in the 1995-1999 period shows an increase in the overall value of each member region or state over each year (see Table 10.1). The same is true for the *per capita* GDP (see Table 10.2) as PPS.

Table 10.3 shows PPS of the Alps-Adria members as a percentage of the EU average for the same period (1995-1999). In this case the trend is more complex with increases and decreases. The Hungarian counties - with the only exception of Somogy in the years 1995-1996 - report a constant increase. Slovenia too has a constant positive trend.

Italian and Austrian Regions and Bavaria show an irregular pattern. In general the years with a decrease (compared to the EU average) were 1997 and 1999 and for some members also 1998.

Gross Domestic Product (GDP)

GDP is a concise measure of the activity of a given economy. GDP is the value of the total output (goods and services) produced by an economy over a given period of time excluding the value of all intermediate products used to produce such (final) total output.

GDP, especially GDP per head (*per capita* GDP), is one of the main indicators of the performance of an economy, it is also much useful to make comparisons over time (trend analysis) and between countries (production capacity analysis).

To compare GDP (and its components) between different countries it is first necessary to convert the values expressed in national currencies into a common currency (in our case the ECU or the EURO).

Such conversion is made using official exchange rates. However, for a number of reasons, exchange rates do not necessarily provide a true reflection of the purchasing power of one currency in another country. The use of exchange rates therefore does not always provide an accurate indication of the amount of goods and services produced and consumed in the different countries.

To reduce such inaccuracy the rate that is used is the *Purchasing Power Parity* (PPP) which is based on the real purchasing power of a given currency. The values obtained after applying PPP are called *Purchasing Power Standard* (PPS).

Purchasing Power Standard

Purchasing Power Parities represent the relation between the number of currency units necessary to buy a basket of goods in a given country and the number of another country's currency units necessary to buy a comparable basket of goods in the second country (the basket of goods need to be representative of the relevant countries and the goods need to be comparable between them).

The relation between the various prices of individual products is aggregated according to well-established criteria in order to obtain comparability between the major groups of products and ultimately comparability of GDPs.

The unit of measure is known as PPS which is, in effect, the Euro/ECU, that is the real (rather than nominal) value of the Euro/ECU.

Research and development

Research and development: includes creative work undertaken on a systematic basis in order to increase the stock of knowledge and the use of this stock of knowledge to devise new applications (Eurostat).

Research and development expenditure: R&D expenses are all funds used for the realisation of R&D. They include current expenses such as employment costs or expenditures on materials, plus capital expenditure on, for example, buildings or equipments. Regional data on R&D are being supplied by Member States on the base of national surveys. Some Member States cannot supply a regional breakdown for all R&D expenses. Some time series can show a break due to methodological revisions or other reasons (Eurostat).

Research and development personnel: R&D personnel includes all persons employed directly on R&D sectors plus any supplying direct services to R & D such as manager, administrative staff and office staff.

Research and development sectors: the structure of the sectors in the R&D domain differs in one major point from the sectorial structure of National Accounts. Due to the special importance of Universities and Technical Colleges, the sector "government" of National Accounts is split in two: "government sector" and "Higher education sector". The latter includes all research institutes, experimental stations and clinics operating under the direct control or administrated by or associated with higher education establishments (Eurostat).
